

Optimal binary search trees:

Nodes: 10, 12, 16, 21  
Freq 4, 2, 6, 3

$\text{cost}(i,j) = \text{sum (freq of } i \text{ to } j) + \min ($   
 $\text{cost } (i+1,j) \rightarrow \text{1st node } i \text{ as root,}$   
 $\text{cost}(i,i) + \text{cost } (i+2,j) \rightarrow \text{2nd node } i+1 \text{ as root,}$   
 $\text{cost}(i,i+1) + \text{cost } (i+3,j) \rightarrow \text{3rd node } i+2 \text{ as root,}$   
 $\cdot$   
 $\cdot$   
 $\text{cost } (i,j-1) \rightarrow \text{last node } j \text{ as root}$   
 $)$

Cost	0	1	2	3
0	4	8/0	20/2	26/2
1		2	10/2	16/2
2			6	12/2
3				3

= sum of frequencies of nodes + min( cost of possible branches)  
= 4 + 2 + 6 + 3 + min (16 , (4+12), (8+3), 20)  
= 15 + 11  
= 26
